

Understanding U.S. Mobility Patterns Through Border and Vehicle Data

Insight #1:

Relationship Between Border Crossings and State Truck Counts

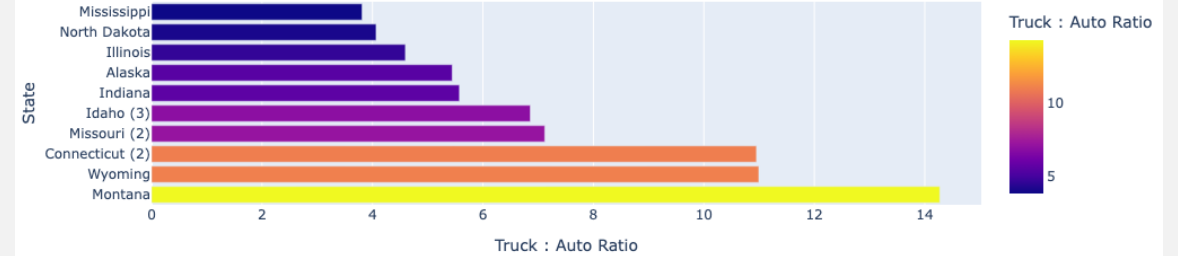

The scatter plot shows a positive relationship between total border crossings and the number of trucks in each state. States with higher truck counts generally have higher border crossing activity, which makes sense because trucks are heavily used for commercial transport. The trendline reinforces this upward pattern, showing that border movement and truck usage increase together.

Insight #4:

Top 10 States by Truck-to-Auto Ratio

This bar chart highlights the states with the highest truck-to-auto ratios. These states rely more heavily on trucks for transportation, suggesting strong commercial shipping routes or low private car usage. Montana and Wyoming stand out with extremely high ratios, showing they have far more trucks than personal vehicles.

Insight #5:

This area chart compares total border crossings across different transportation categories. Personal vehicle passengers dominate all crossing types, followed by pedestrians. Rail, bus, and truck container movements are significantly smaller. The chart shows which transportation modes contribute most to U.S. border activity.

Border Crossings by Measure (Area Chart)
